Manual No. PT9640 Adjusting Instructions & Illustrated Parts List for 35800 Series Machines

Forth Edition Copyright 2002
By
Union Special Corporation Rights Reserved In All Countries
Printed in U.S.A. October 2002

PREFACE

This parts manual has been prepared to assist you in locating individual parts or assemblies on 35800 Series machines.

It is the desire of Union Special that each machine run at its optimum performance. Parts listed in this manual are designed specifically for your machine and are manufactured with utmost precision to assure long lasting service.

This manual has been comprised on the basis of available information. Changes in design and/or improvements may incorporate a slight modification of configuration in illustrations or part numbers.

On the following pages are illustrations and terminology used in describing the parts used on 35800 Series machines.

SAFETY RULES

1. Before putting the machines described in this manual into service, carefully read the instructions. The starting of each machine is only permitted after taking notice of the instructions and by qualified operators.

IMPORTANT! Before putting the machine into service, also read the safety rules and instructions from the motor supplier.

2. Observe the national safety rules valid for your country.
3. The sewing machines described in this instruction manual are prohibited from being put into service until it has been ascertained that the sewing units which these sewing machines will be built into, have conformed with the EC Council Directives (89/392/EEC, Annex II B).

Each machine is only allowed to be used as foreseen. The foreseen use of the particular machine is described in paragraph "STYLES OF MACHINES" of this instruction manual. Another use, going beyond the description, is not as foreseen.

4. All safety devices must be in position when the machine is ready for work or in operation. Operation of the machine without the appertaining safety devices is prohibited.
5. Wear safety glasses.
6. In case of machine conversions and changes all valid safety rules must be considered. Conversions and changes are made at your own risk.
7. The warning hints in the instructions are marked with one of these two symbols:

8. When doing the following the machine has to be disconnected from the power supply by turning off the main switch or by pulling out the main plug:
 - 8.1 When threading needle(s), looper, spreader etc.
 - 8.2 When replacing any parts such as needle(s), presser foot, throat plate, looper, spreader, feed dog, needle guard, folder, fabric guide etc.
 - 8.3 When leaving the workplace and when the workplace is unattended.
 - 8.4 When doing maintenance work.
 - 8.5 When using clutch motors without actuation lock, wait until the motor is stopped totally.
9. Maintenance, repair and conversion work (see item 8) must be done only by trained technicians or special skilled personnel under consideration of the instructions.
10. Any work on the electrical equipment must be done by an electrician or under direction and supervision of special skilled personnel.
11. Work on parts and equipment under electrical power is not permitted. Permissible exceptions are described in the applicable sections of standard sheet DIN VDE 0105.
12. Before doing maintenance and repair work on the pneumatic equipment, the machine has to be disconnected from the compressed air supply. In case of existing residual air pressure, after disconnecting from compressed air supply (i.e. pneumatic equipment with air tank), the pressure has to be removed by bleeding.

IDENTIFICATION OF MACHINES

Each UNION SPECIAL machine is identified by a style number, which is stamped into the style plate affixed to the middle of the machine under the tension assembly.

The serial number is stamped in the casting at the right rear base of the machine.

CLASS DESCRIPTION

High Speed, Feed-Off-The-Arm High Throw Machines, Two and Three Needle, Left Needle In Front. Light Weight Presser Bar Mechanism, Adjustable Looper Avoid, Space in Front of Needles 8" (203.2 mm), Single Disc Looper Thread Take-Up, Automatic Enclosed Type Oiling System and Filter Type Oil Pump, Visual Sight Oil Action and Supply Gauges, .588" [19/32", 15.1mm] wide roller.

STYLE OF MACHINES

35800BLW	DOUBLE LAP SEAM. Three needle, high capacity, differential feed with low lift feed eccentric and upper driven roller feed. -Typical Application- For in seams on medium weight denim garments. Seam Specification 401 LSc-3. Standard gauge Number 9 [9/64", 3.6mm]. Recommended needle 130GS, size 125/049. Maximum recommended speed 4500 R.P.M.. .040 step sewing parts.
35800BLWP	Same as 35800BLW except presser and roller bars are equipped with double acting air cylinders. Air is used to supply down pressure and lift for presser foot and roller assembly.
35800BQW	DOUBLE LAP SEAM. Three needle high capacity, plain feed, upper driven, roller feed. - Typical Application- For in and out seams on medium weight denim garments. Seam Specification 401 LSc-3. Standard gauge Numbers 8 [1/8", 3.2mm] and 9 [9/64", 3.6mm]. Recommended needle 130GS, size 125/049. Maximum recommended speed 4500 R.P.M.. .040 step sewing parts.
35800BQWP	Same as 35800BQW except presser and roller bars are equipped with double acting air cylinders. Air is used to supply down pressure and lift for presser foot and roller assembly.
35800BRW	DOUBLE LAP SEAM. Three needle, high capacity, plain feed, upper driven, roller feed. Feed Dogs have higher teeth on front. - Typical Application- For seat seaming, in and out seams on medium to heavy weight denim garments. Seam Specifications 401LSc-3. Standard gauge Numbers 8 [1/8", 3.2mm] and 9 [9/64", 3.6mm]. Recommended needle 130GS, size 140/054. Maximum recommended speed 4500 R.P.M.. .094 step sewing parts.
35800BRWP	Same as 35800BRW except presser and roller bars are equipped with double acting air cylinders. Air is used to supply down pressure and lift for presser foot and roller assembly.
35800BRWL	DOUBLE LAP SEAM. <i>Same as 35800BRW without the folder.</i>
35800BRWPL	Same as 35800BRWL except presser and roller bars are equipped with double acting air cylinders. Air is used to supply down pressure and lift for presser foot and roller assembly.
35800BWW	DOUBLE LAP SEAM. Two and three needle, high capacity, differential feed, high lift feed eccentric, with upper driven, roller feed. Feed Dogs have higher teeth on front. - Typical Application- For in and out seaming on heavy weight denim garments. Seam Specifications 401 LSc-2 or 401 LSc-3. Standard gauge Numbers 8 [1/8", 3.2mm], 9 [9/64", 3.6mm], 18 [9/32", 7.2mm]. Recommended needle 130GS, size 140/054. Maximum recommended speed 4500 R.P.M.. .094 step sewing parts. NOTE: 18 gauge available with two needles only.

STYLE OF MACHINES (CONT.)

35800BWWP	Same as 35800BWW except presser and roller bars are equipped with double acting air cylinders. Air is used to supply down pressure and lift for presser foot and roller assembly.
35800BWWL	DOUBLE LAP SEAM. <i>Same as 35800BWW without the folder.</i>
35800BWWPL	Same as 35800BWWL except presser and roller bars are equipped with double acting air cylinders. Air is used to supply down pressure and lift for presser foot and roller assembly.
35800BWDN	Lower differential feed high step throat plate, wide presser foot with seam groove feed dogs flat front to back belt-driven, wide steel teeth feed roller.
35800BWDR	Plain feed high step throat plate wide presser foot with seam groove raised front teeth on feed dogs belt-driven, wide steel teeth feed roller.
35800BRWH	Same as BWDR above, except with feed dogs flat front to back and smooth rubber feed roller

ILLUSTRATIONS

This manual has been arranged to simplify ordering repair parts. Exploded views of various sections of the mechanism are shown so that the parts may be seen in their actual position in the machine. On the page opposite the illustration will be found a listing of the parts with their part numbers, description and the number of pieces required in the particular view being shown.

Numbers in the first column are reference numbers only, and merely indicate the position of the part in the illustration. The reference number should never be used in ordering parts. Always use the part number listed in the second column.

Component parts of sub-assemblies which can be furnished for repairs are indicated by indenting their descriptions under the description of the main sub-assembly. As an example refer to the following text.

9.	29126 EC	Upper Looper Drive Shaft Assembly	1
10.	22503 F	Screw	1
11.	39543 E	Cam Follower Locking Clamp	1

It will be noted in the previous example that the cam follower, bushing and cam guide and the upper looper drive shaft are not listed. The reason is that replacement of these parts individually is not recommended, so the complete upper looper drive shaft assembly should be ordered.

When a part is common to all machines covered in this manual, no specific usage will be mentioned in the description. However, when the parts for the various machines are not the same, the specific usage will be mentioned in the description and, if necessary, the difference will be shown in the illustration.

A numerical index of all the parts shown in this manual is located at the back. This will facilitate locating the illustration and description when only a part number is known.

IDENTIFYING PARTS

Where the construction permits, each part is marked with its part number. On some of the smaller parts and on those where construction does not permit, an identification letter is marked in to distinguish the part from similar ones.

PLEASE NOTE: Part numbers represent the same part, regardless of which manual they appear. On all orders please include part number, name and style of machine for which the part was ordered.

TERMS

Prices are net cash and subject to change without notice. All shipments are forwarded F.O.B. shipping point. A charge is made to cover postage and insurance.

THREADING & OILING FOR PLAIN FEED

FIG. 1

THREADING & OILING FOR DIFFERENTIAL FEED

FIG. 1

Needle Type	Description	Sizes Available
130GS	Short double groove, struck groove, ball eye, spotted, government point, chromium plated.	080/032, 090/036, 100/040, 110/044, 125/049, 140/054, 150/060

Table I

NEEDLES

Selection of proper needle size is determined by size of thread used. Thread should pass freely through the needle eye in order to produce a good stitch formation.

Each needle has both a type and size number. The type number denotes the kind of shank, point, length, groove, finish and other details. The size number, stamped on the needle shank, denotes largest diameter of blade, measured midway between shank and eye. Collectively, type and size number represent the complete symbol which is given on the label of all needles packaged and sold by UNION SPECIAL. See "STYLE OF MACHINES" for the standard recommended needle type & size for your machine.

To have needle orders promptly and accurately filled, an empty package, a sample needle, or the type and size number should be forwarded. Use the description on the label. A complete order would read: "1000 Needles, Type 130GS, Size 140/054".

LUBRICATION

The oil has been drained from the machine before shipping and the reservoirs must be filled before beginning to operate. Use a straight mineral oil with a Saybolt viscosity of 90 to 125 seconds at 100° Fahrenheit. Union Special Part No. 28604R.

Oil is filled at oil caps (A & D, Fig. 1). The level is checked at sight gauges (B) and (E). Maintain the oil level between the red lines of the gauges.

The machine is equipped with a continuous running rotary driven oil pump. The action of the oil can be observed through oil sight (A) and (D) in the front and back top covers.

When starting a new machine, filling the reservoirs or when beginning to operate a machine that has been idle for some time, it may be necessary to prime the pump. To do this, remove the two plug screws (C). Apply oil to these holes and operate machine until bubbling can be observed at the windows. Replace screws (C).

CAUTION: If oil does not bubble when machine is running, the circulating pump is inoperative.

Oil may be drained from the machine at two places, plug screw (F) located in the bottom of the cylinder and plug screw (G) at the back of the main frame below the handwheel.

THREADING

A convenient means for threading the looper has been provided. When loopers are at the left end of their travel, press the knob (H, Fig. 1) and loopers will back out of position, leaving them easily accessible. Thread the machine as illustrated in (Fig. 1). After threading, push loopers back into position.

ADJUSTING INSTRUCTIONS

NOTE: Instructions stating direction of location, such as right, left, front or rear of machine, are given relative to operator's position at the machine. The handwheel rotates counterclockwise, in operating direction; when viewed from the right end of machine.

TORQUE REQUIREMENTS

Torque specifications given in this catalog are measured in inch-pounds or Newton-meters. All straps and eccentrics must be tightened to 19-21 in. lbs. (2.1-2.3Nm) unless otherwise noted. All nuts, bolts, screws, etc., without torque specifications must be secured as tightly as possible, unless otherwise noted. Special torque specifications for connecting rods, links, screws etc., are shown on the parts illustrations.

SYNCHRONIZING NEEDLE AND LOOPER MOTIONS

NOTE: Needle and looper mechanisms are carefully synchronized with precision gauges before leaving the factory to insure the best possible sewing conditions.

Should it become necessary to disassemble the main shaft or replace components of the needle or looper drive mechanisms, re-synchronization of the machine will be required to facilitate proper sewing adjustments. This is accomplished by means of an adjustable split coupling located beneath the rear top cover, connecting the crankshaft to the main shaft, which in turn drives the looper mechanism.

To synchronize the machine, remove the needles, presser foot, throat plate, feed dogs and upper feed roller mechanism. Rotate handwheel in the operating direction until the needle bar is at the bottom of its stroke and just begins its upward travel. Loosen screw (A, Fig. 2) and remove the looper for the left hand needle from the looper holder. Insert a straight steel rod (B) 5/32" (3.9mm) or 11/64" (4.3mm) diameter by 2-1/2" (63.5mm) long into looper holder and retighten screw (A). It may be necessary to reposition the looper holder so that the rod (B) will be in a vertical position when at its farthest travel to the right. Rotate the handwheel until the rod is at extreme left, reinstall the throat plate. Turn the handwheel in the operating direction, with needle bar rising until rod (B) comes in contact with the edge of the throat plate. At this point, clamp Union Special timing gauge TT147 (C) around the needle bar (D), flush against the underside of the machine casting (E). Rotate handwheel in the opposite direction until either the gauge contacts the machine casting on the up stroke of the needle bar or the rod contacts the edge of the throat plate. Maximum allowable clearance between gauge and casting or rod and throat plate is .005" (0.1mm)

FIG. 2

If machine is not synchronized the following applies:

Both ends of the adjustable split coupling are secured to the crankshaft and main shaft by spot screws and set screws. On the main shaft end of the coupling (A, Fig. 3) three screws (B) thread horizontally through the coupling. The holes in the main shaft end of the coupling are larger than the diameter of the screws, permitting several degrees of rotation in either direction to properly synchronize the needle and looper. Loosen the three horizontal clamp screws (B, Fig. 3). With rod (B, Fig. 2) at its farthest position to the left, snug the uppermost horizontal clamp screw enough to hold coupling (A, Fig. 3) in position. If the handwheel is turned in reverse of operating direction and gauge (C, Fig. 2) on needle bar (D) contacts the machine casting (E) before rod (B) contacts the edge of the throat plate, loosen horizontal clamp screw (B, Fig. 3) which was snug, while holding the coupling in place with an Allen wrench in set screw (C). Rotate the handwheel slightly in reverse of operating direction, snug the uppermost horizontal clamp screw (B), recheck synchronization. If the handwheel is turned in reverse of operating direction and the rod contacts the edge of the throat plate before the clamp gauge contacts the machine casting, adjust as before, except turn the handwheel slightly in the

FIG. 3

operating direction. Use shim stock to insure no more than .005" (0.1mm) exists between gauge and casting or between rod and throat plate, in both the operating and reverse directions of the handwheel. When this setting has been made, tighten the three horizontal clamp screws (B, Fig. 3) securely, and recheck both clearance points with .005" (0.1mm) shim gauge to assure no slippage occurred while tightening the screws.

TIGHTENING NEEDLE HEAD

When replacement of the needle bar, and or needle head is necessary, torque the needle head to needle bar 14-16 in. lbs. (1.6-1.8Nm) or use torque rod No. 21227AR that has been supplied with the machine, for the purpose of eliminating the possibility of distorting the needle bar due to overtightening. Insert the torque rod in the hole at the upper end of the needle bar, while holding the needle bar head with a suitable tool, turn the needle bar with the torque rod onto the needle bar head. When the rod starts to bend, the needle bar head has been threaded into the needle bar properly.

ALIGNING NEEDLES IN THROAT PLATE SLOTS

Insert a new set of needles, type and size specified, with screw (B, Fig. 4) slightly loosened, lower needle bar (A) and turn needle head as required until the needles are centered in the throat plate needle hole slots. Tighten screw (B) torque to 19-21in.lbs. (2.1-2.4Nm).

NOTE: If the needles can not be aligned in the throat plate slots, the lower cylinder must be moved as stated below.

CENTERING THE CYLINDER

Remove the top front cover and gasket from the main frame. Loosen cylinder holding screw (A, Fig. 5). Turn eccentric screw (B) clockwise or counterclockwise to move the cylinder so the needles are centered in the needle holes. Tighten screw (A) and recheck settings.

NOTE: The cylinder may not move freely when the eccentric is turned because the joint sealant compound has set.

SETTING THE LOOPER

Insert a new set of needles, type and size specified. Always adjust the looper (A, Fig. 6) for the left needle first. Set the looper so that the distance from the center of the needle (B) to the point of the looper (A) is $9/64$ " (3.6mm) when the looper is at its farthest position to the left. Looper gauge (C) No. 21225-9/64 can be used advantageously in making this adjustment. If adjustment is required, loosen screw (A, Fig. 7) in looper holder, permitting movement in either direction to attain the $9/64$ " (3.6mm) dimension as shown in Fig. 6. Retighten screw (A, Fig. 7). Repeat for other needles and loopers.

Rotate handwheel in operating direction to assure that the looper point passes to the rear of the needle to touch but not to deflect the needle. This adjustment can be made by loosening screw (A, Fig. 7) in looper holder. Looper holder can be moved front to back to attain looper to needle setting. Always check the $9/64$ " (3.6mm) looper gauge setting after setting the looper to the back of the needle, and conversely, always check the setting of the looper to the back of the needle after setting the $9/64$ " (3.6mm) looper gauge.

The amount of looper avoid has been set at the factory to .110" (2.8mm). If it becomes necessary to adjust the amount of avoid it is recommended as a starting point, to have the points of the descending needles contact the back of the lower 1/3 of the back of the looper blade. (See Fig. 7).

FIG. 4

FIG. 5

FIG. 6

FIG. 7

FIG. 8

SETTING THE LOOPER AVOID PLAIN FEED

If more or less looper avoid motion is required, remove cylinder side cover (A, fig 8) located at the lower front left side. For Plain feed use a screwdriver to loosen looper avoid link ball joint (B, fig 8) (for differential feed use TT-5 wrench to loosen looper avoid link screw C, fig 8). Moving ball joint down in the lever slot increases the amount of looper avoid motion, moving it up acts the reverse. Retighten ball joint B, Plain feed (screw C, differential feed) securely.

NOTE: Whenever looper avoid is changed looper clearance to needle must also be reset.

FIG. 9

SETTING HEIGHT OF NEEDLE BAR

The height of the needle bar is correct when the top of the needle eye is 1/16" (1.6mm) below the underside of the looper, with the looper point even with the right side of the needle. To make adjustment loosen screw (A, Fig. 9) and move needle bar (B) as required to attain dimension.

NOTE: Care must be taken not to disturb the alignment of the needles when moving the needle bar either up or down.

SETTING THE FEED DOGS FOR PLAIN FEED

Assemble the main feed dog and throat plate. Main feed dog (A, Fig. 11) at its highest position, should be set to project above the throat plate, slightly more than the depth of its teeth for Style 35800BQW and slightly more than the depth of its lower teeth for Styles 35800BRW, BRWL. The feed dog mounting screw (B) and front support screw (C) should be set to maintain this setting.

FIG. 10

The feed should be set so there is equal clearance between the front of the feed dog and the front of the feed slot in the throat plate when the feed dog is at its most forward travel. The same amount of clearance should be between the back of the feed dog and the back of the feed slot in the throat plate when the feed dog is at its most rearward travel. To attain this setting loosen screws (A and B, Fig. 10) and remove plug screw (D). Using a screw driver turn eccentric pin (C) clockwise or counterclockwise to obtain proper setting. Tighten screws (A and B), reinstall plug screw (D).

SETTING THE FEED DOGS FOR DIFFERENTIAL FEED

Before assembling the main and differential feed dogs, set the feed bar eccentric pin (A, Fig. 10A) located in the left side near center of cylinder, so that the slot in the head is in a horizontal position for the 35800BWDN, BLW style machines and turned counter clockwise to an approximate 45° for the 35800BWW style of machine. The pin can be used to slightly tilt both feed dogs if necessary. The feed bar pin is retained in position by set screw (B). Assemble differential feed dog (A, Fig. 11A), main feed dog (B) and throat plate. Both the main and differential feed dogs can be individually adjusted to height. Main feed dog (B) at its highest position, should be set to project above the throat plate, the depth of its teeth. If adjustment is necessary loosen screw (D) and move feed dog (B) up or down to attain correct setting. Feed dog support (C) should support front of feed dog.

NOTE: If eccentric pin (A, Fig. 10A) is used to tilt the feed dogs, make sure that the looper does not interfere with the rear needle guard and that the needle guard does not pinch the needle loops on the back side of the needles.

FIG. 10A

SETTING THE FEED DOGS FOR DIFFERENTIAL FEED (CONT.)

If adjustment is necessary loosen screw (E, Fig. 11A) in feed dog support (C) and move as required. Retighten screw (E). The differential feed dog (A) may then be leveled with main feed dog (B). If adjustment is necessary loosen screw (F) and move feed dog up or down as required. Retighten screw (F).

NOTE: Should the main feed dog require repositioning due to contact with the throat plate in its forward or rearward travel, loosen set screw (C, Fig. 10A) in main feed bar driving link (D), rotate main feed bar eccentric driving stud (E) as required. Driving stud (E) has a thin hexagon head with cutouts on two of the flats allowing movement by tapping with a sharp pointed tool, when wrench 21388AZ is not available. Whenever the main feed bar eccentric driving stud position has been changed, recheck rear needle guard setting, adjustment may be required. Retighten set screw (C). Position main feed dog support (C, Fig. 11A) flush against bottom of main feed dog (B), tighten support screw (E) securely.

FIG. 11

FIG. 11A

CHANGING STITCH LENGTH

When change in stitch length is required, remove large plug screw (A, Fig. 12). Loosen feed rocker driving link screw (B) in lever (C). Moving the feed rocker driving link up in the lever slot lengthens the stitch, moving it down, shortens the stitch. Retighten link screw (B) securely and replace plug screw (A).

NOTE: If plug screw (A) is replaced with a new plug screw, it should be sealed with a silicone seal.

Any stitch length change, requires resetting the needle guard.

CAUTION: When making stitch length adjustment do not exceed maximum recommended stitch length due to possible part damage.

FIG. 12

SETTING REAR NEEDLE GUARD

Set the rear needle guard (A, Fig. 13) horizontally so that it barely contacts needles (B) when at its extreme forward position. If adjustment is necessary loosen screw (E) and move guard front to back as required. It should be set vertically as low as possible, yet have its guarding surface in contact with the needles until the points of the loopers (C), moving to the right, are even with the right side of the needles. If adjustment is necessary loosen screw (F) and move guard and holder up or down as required.

CAUTION: If stitch length is changed, needle guard must be reset.

NOTE: When installing the needle it should be parallel with the eye in line of feed. If adjustment is necessary, loosen screw (N, Fig. 15) in needle head and rotate needle to attain adjustment (D, Fig. 13).

FIG. 13

PRESSER FOOT AND PRESSER BAR ADJUSTMENT

FIG. 14

Adjusting or Replacing Presser Foot:

Remove presser bar knob (A, Fig. 14) and spring (B). Loosen screw (A, Fig. 15) on presser bar guide (B). (Loosen screws (C) in upper stop collar for pneumatic machines only). Slide presser bar upward high enough to slip on presser foot yoke (E) with foot attached and tighten screw (F) on flat of presser bar. Position foot so that the needle holes in the foot line up with the holes in the throat plate. Tighten screw (A)

Presser foot guide plates (G, Fig. 15) should be set so that entire presser foot and bar assembly has free movement up and down with no left to right movement.

With foot properly aligned on throat plate and presser bar guide (B) securely fastened to presser bar, adjust both guide plates (G) to obtain above setting. Tighten four screws (H).

Reinstall presser bar spring (B, Fig. 14) and knob (A), with presser foot resting on throat plate.

For pneumatic machines:

Set upper stop collar (K) to contact casting, so the bottom of the needle head and the top of the presser foot do not touch, at the bottom of the needle stroke when lifting foot. Tighten screw (C).

The presser foot should be adjusted to be 1/8" (3.17mm) above the throat plate before the feed roller mechanism begins to rise. Loosen screw (A, Fig. 15) in presser bar lifter and guide (B, Fig. 15), raise or lower guide as required to attain the specified point at which the feed roller begins to rise. Retighten screw (A) and maintain needle settings.

NOTE: There should be a minimum 1/32" (0.8mm) clearance between screw (M, Fig. 15) and the bottom of the slot in link (J).

Regulate the pressure on the presser foot by turning the presser spring regulating knob (A, Fig. 14) located on top of pressure foot spring (B).

To remove just the presser foot, remove screws (L, Fig. 15) and replace foot, retighten screws (L).

FIG. 15

UPPER FEED ROLLER ADJUSTMENT

Assembly of Roller to Roller Yoke:

Assemble driven gear (A, Fig. 16) through feed roller frame (B). Place woodruff key (C) into slot of feed roller shaft (D). Slide driven gear (E) on to shaft (D), make sure key (C) goes into slot in gear (E). While holding feed roller frame (B) with steel roller (F) between the two frame lobes, slide feed roller shaft (D) and assembled components through frame. Make sure that shoulder of roller (F) is to the right. Align screw (G) (first in operating direction on roller) on the flat of shaft (E). At the same time thrust shoulder of shaft (D) against face of gear (E), make sure left edge of roller is against right (inside) face of left lobe. Secure screw (G) on flat of shaft (D) and tighten screw (H).

FIG. 16

UPPER FEED ROLLER ADJUSTMENT (CONT.)

When feed roller mechanism (C, Fig. 17) has been removed or replaced, .003" (0.08mm) minimum to .005" (0.13mm) maximum clearance should be maintained between roller and throat plate.

To Adjust Guiding System for Roller:

Loosen two screws (A). Using shim(s) adjust feed roller mechanism (C) so that the roller is .003" (0.08mm) to .005" (0.13mm) above throat plate. Slide rear guide finger (B) down so that it sits on top of rear guide support block (D). Check to make sure roller is parallel to throat plate slots. Tighten two screws (A) to secure feed roller mechanism in place.

Setting Pressure for Feed Roller:

Regulate the pressure on the feed roller so that it exerts only enough pressure on the fabric to feed the work uniformly. Turning roller presser spring regulator (H, Fig. 17) clockwise to increase or counterclockwise to decrease the pressure.

Setting of Feed Roller:

Guide finger for roller should be set so that entire roller mechanism has free movement up and down with no left to right movement. With roller properly aligned, the edge of roller should be parallel with feed slots in throat plate.

Guide plates (F) must be thrust against guide finger (B) to secure feed roller mechanism (C). Thrust guide plates (F) against guide finger (B) with equal pressure. Tighten four screws (E) to hold plates in place.

FIG. 17

THREAD TENSION AND RELEASE

The thread tension release is set correctly when it begins to function at the point when the upper feed roller begins to rise. When adjustment is necessary, loosen screw (B, Fig. 18) in lifter lever (C). Facing the tension release shaft (A) from the right end of the machine, insert screwdriver in slot in shaft (A). Turn the screwdriver clockwise to raise pins (D) or counterclockwise to lower pins. Retighten screw (B).

FIG. 18

DIFFERENTIAL CONTROL

The amount of differential is controlled by lever (A, Fig. 19). The adjusting plate is numbered from 1 to 9. When the lever is set from numbers 1 to 4 reverse differential or stretching occurs. The numbers from 4 to 5 produce equal feed stitching while numbers 5 to 9 produce a gathering stitch. Screws (B) can be set to limit the movement of lever (A) or lock lever in one position. If top ply of material is coming out long, move lever toward operator, if top ply is short, move lever away from operator, as required.

FIG. 19

SETTING NEEDLE THREAD TAKE-UP AND FRAME EYELET

FIG. 20

With the needle bar at the top of its stroke set the adjustable frame needle thread eyelet (A, Fig. 20) in the lower mounting hole of eyelet (B) so the needle thread from eyelet (A) to the needle lever thread eyelet (C) will be in a straight line. If adjustment of eyelet (A) is necessary loosen screw (K) and move eyelet up or down as required. Retighten screw (K).

With the needle bar at the bottom of its stroke, the needle thread take-up (D) should be set so that it is 1/16" (1.6mm) above the edge of the needle lever thread eyelet (C) (See Inset). If adjustment is necessary loosen screw (H) and adjust lever (D) as required to attain 1/16". Tighten screw (H).

LOOPER THREAD TAKE-UP ADJUSTMENT

FIG. 21

With the machine rotating in operating direction the looper thread take-up is in time when the first screw coming into view (A, Fig. 21) is in line with the spot screw (B) on the main shaft in the pulley. NOTE: screw (A) is accessible through the hole in the take-up. With this setting correct, the looper thread should cast-off of the take-up (C) when the needles are safely in the triangle. If adjustment is necessary loosen two screws (A) in take-up (C) position screws in line with spot screw (B). Tighten screws (A).

NOTE: Make sure take-up cam is centered left to right in cast-off slot.

FOLDER ADJUSTMENT

Slide folder (A, Fig. 22) on arm. The folder should be as close to the front of presser foot (B) as possible, making sure to avoid the presser foot contacting the folder when sewing across seams. If adjustment is necessary loosen screws (C) to move entire folder left to right or front to back as required. If just adjustment of upper scroll (D) is needed loosen screw (E) and position scroll to obtain proper seam margin.

AIR BLOWER TUBE ADJUSTMENT

The air blower tube should be set left to right so it is parallel with the throat plate. It should be set front to back so when feeding over a cross seam the presser foot does not contact the tube. If adjustment is necessary, loosen screw (A, Fig. 23) and position air blower tube (B) as required. Retighten screw (A).

PULLER ADJUSTMENTS

Timing of the Puller Mechanism:

Loosen two screws (A, Fig. 24) in upper sprocket, rotate machine in operating direction, with needle moving up until needle points are flush with top of throat plate (B). At this point, feed dogs are above throat plate but have not made any movement towards the rear. Rotate puller shaft (C) in operating direction until puller (D) shows some movement clockwise. At this time tighten two screws (A) in upper sprocket.

Setting Travel of Puller (stitch length):

Loosen nut (E, Fig. 24) and turn screw (F) clockwise to shorten puller travel or counterclockwise to lengthen puller travel. Tighten nut (E). Sewing sample should be checked to assure that proper stitch length is obtained.

FIG. 22

FIG. 23

FIG. 24

PNEUMATIC ADJUSTMENTS

Pneumatic settings can vary between different sewing applications. For best results set all air lines and air pressure settings as in (Fig. 25).

If air lines are disconnected follow connection as in (Fig. 25).

Air pressure settings should be set with air regulators as shown in (Fig. 26).

Air lines should be attached with each end of line to corresponding letter (Fig. 25).

Fig. 25

Fig. 26

ADJUSTING STOP COLLAR ON FEED ROLLER FOR PNEUMATIC MACHINES

When feed roller mechanism (A, Fig. 27) and/or puller shaft cylinder assembly (B, Fig. 27) has been removed or replaced, 1/64" (0.4mm) clearance should be maintained between upper connection (C, Fig. 27) and floating feed roller connection (D, Fig. 27) when feed roller mechanism is in up position.

Turn off air supply to puller shaft air cylinder assembly (B, Fig. 27). Loosen screw (E, Fig. 27). Lift feed roller mechanism (A, Fig. 27) until there is 1/64" (0.4mm) clearance between upper connection (C, Fig. 27) and floating feed roller connection (D, Fig. 27). Slide roller stop collar (F, Fig. 27) and rubber washer (H, Fig. 27) up until they contact the underside of head assembly (G, Fig. 27). Retighten screw (E, Fig. 27).

LOOPERS, LOOPER HOLDERS, FEED DRIVE COMPONENTS AND LOOPER AVOID
COMPONENTS FOR DIFFERENTIAL FEED

Ref. No.	Part No.	Description	Amt. Req.
1.	35848B	Looper Holder, marked "A", for right looper	1
2.	22562A	Screw	1
3.	22564	Screw	1
4.	35848E	Looper Holder, marked "D", for middle looper	1
5.	22562A	Screw	1
6.	22564	Screw	1
7.	35848D	Looper Holder, marked "C", for left looper	1
8.	22562A	Screw	1
9.	22564	Screw	1
10.	35809AY	Looper, marked "AV", for right needle	1
11.	35808AY	Looper, marked "AU", for left needle	1
12.	35809BY	Looper, marked "AY", for middle needle	1
13.	35849C	Looper Rocker Shaft	1
14.	258A	Nut	1
15.	35836C	Feed Rocker Driving Link Screw	1
16.	660-207	Oil Seal Ring	1
17.	36236A	Feed Drive Shaft	1
18.	36236H	Bushing, for feed rocker driving link	1
19.	36236C	Feed Rocker Driving Link	1
20.	62238A	Link Pin	1
21.	29478EC	Feed Drive Assembly	1
22.	22894W	Screw	1
23.	22894U	Screw	1
24.	35866	Nut	1
25.	36236B	Bushing	1
26.	22733G	Screw	1
27.	35766B	Nut	1
28.	29478DZ	Looper Drive Connecting Rod Assembly	1
29.	35722AF	Main Shaft Complete	1
30.	35853AJ	Looper Drive Connection	1
31.	35895V	Shaft Stop Washer	1
32.	22526	Screw	1
33.	35853V156	Hinge Pin	1
34.	660-310	Truarc Ring	2
35.	35853AK	Looper Drive Connecting Rod	1
36.	50-458BLK	Pin	1
37.	56341G	Locking Spring	1
38.	22729C	Screw	2
39.	36278C	Stud, for looper shaft sleeve	1
40.	22560A	Screw	1
*41.	35851S	Connecting Rod Bearing Shell	1
*42.	35851P	Screw	2
43.	36249B	Looper Shaft Sleeve	1
44.	35751G	Looper Shaft Collar	1
45.	22572B	Screw	1

*For older style machines these parts
must be purchased as assembly 29478FH

UPPER ROLLER FEED, FOOT LIFTER AND THREAD TENSION PARTS

Ref. No.	Part No.	Description	Amt. Req.
1.	36280V	Lifter Lever Link Assembly	1
2.	36280U	Lifter Lever Link	1
3.	22585C	Screw	2
4.	86	Screw	2
5.	35892A	Puller Bar Knob, rear	1
6.	50377L	Spring, puller bar	1
7.	22758C	Screw	2
8.	35835F	Lifter Lever Bell Crank Link	1
9.	35877AM	Roller Presser Bar	1
10.	29478ED	Puller Assembly for, 35800BLW, 35800BQW, 35800BWW, 35800BWDN, 35800BWDR	1
-	29478EL	Puller Assembly for, 35800BRWH	1
11.	54274C	Feed Roller Lower Connection	1
12.	22894P	Screw	2
13.	14649	Drive Gear Collar	1
14.	88	Screw	2
15.	22894C	Screw	1
16.	22738	Screw	4
17.	35875Z	Gear guard, rear	1
18.	35877AA	Woodruff Key	1
19.	35873AK	Feed Roller Shaft	1
20.	35875X	Driven Miter Gear	1
21.	35875Y	Drive Miter Gear	1
22.	35873AJ	Feed Roller Frame	1
23.	660-303	Needle Bearing	2
24.	35875AA	Gear Guard, front	1
25.	21237ES	Air Blower Tube	1
26.	73C	Screw	1
27.	35826X	Feed Roller	1
28.	22894W	Screw	2
*29.	35826DZ	Wide Rubber Roller For 35800BRWH	1
*30.	22894W	Screw	2
*31.	35826CB	Feed Roller, Same as 35826X but reverse teeth	1
*32.	22894W	Screw	2

33. thru 69. See following page.

*Items can be purchased as an extra send charge.

UPPER ROLLER FEED, FOOT LIFTER AND THREAD TENSION PARTS (CONT.)

Ref. No.	Part No.	Description	Amt. Req.
1. thru 32. See preceding page.			
33.	35822AE	Presser Bar	1
34.	35843D	Presser Bar Lifter and Guide	1
35.	SD0640241SP	Screw	1
36.	SS7111410TP	Screw	1

11.	35830BXW8	Presser Foot, for Styles 35800BRW8, BRWL8	1
12.	35824DQW8	Throat Plate, for Styles 35800BRW8, BRWL8	1
13.	35805BRW8	Main Feed Dog, for Styles 35800BRW8, 9 BRWL8, 9 BWDR8, 9	1
14.	35830BXW8	Presser Foot, for Styles 35800BWDR8	1
-	35830BXW9	Presser Foot, for Styles 35800BRW9, BRWL9, BRWH9, BWDR9	1
15.	35824DQW8	Throat Plate, for Styles 35800BWDR8	1
-	35824DQW9	Throat Plate, for Styles 35800BRW9, BRWL9, BRWH9, BWDR9	1
16.	35805BRWH9	Main Feed Dog, for Styles 35800BRWH9	1

SEWING PARTS FOR DIFFERENTIAL FEED

Ref. No.	Part No.	Description	Amt. Req.
1.	35830DY	Presser Foot Fork	1
2.	22894BJ	Screw	1
3.	35830K	Spring	1
4.	22599	Screw	1
5.	22845A	Screw	2
6.	35830DWW8	Presser Foot, for Styles 35800BWW8, BWWL8	1
-	35830DWW9	Presser Foot, for Styles 35800BWW9, BWWL9	1
7.	35824DX8	Throat Plate, for Styles 35800BWW8, BWWL8, BWDN8	1
-	35824DX9	Throat Plate, for Styles 35800BWW9, BWWL9, BWDN9	1
-	35830DN8	Presser Foot, for Style 35800 BWDN8	1
-	35830DN9	Presser Foot, for Style 35800 BWDN9	1
8.	35826DX	Differential Feed Dog, for Styles 35800 BWW8, 9, BWWL 8, 9	1
-	35826ED	Differential Feed Dog, for Styles 35800 BWDN8, 9	1
9.	35805DX	Main Feed Dog, for Styles 35800 BWW8, 9, BWWL8, 9	1
-	35805EB8	Main Feed Dog, for Styles 35800 BWDN8, 9	1
10.	35830DWW18	Presser Foot, for Styles 35800 BWW18, BWWL18	1
11.	35824DW18	Throat Plate, for Styles 35800 BWW18, BWWL18	1
12.	35826DX	Differential Feed Dog, for Styles 35800BWW18, BWWL18	1
13.	35805DW18	Main Feed Dog, for Styles 35800 BWW18, BWWL18	1
14.	35820BQW9	Presser Foot, for Style 35800 BLW9	1
15.	35824BQW9	Throat Plate, for Style 35800 BLW9	1
16.	35826DLW9	Differential Feed Dog, for Style 35800 BLW9	1
17.	35805DLW	Main Feed Dog, for Style 35800 BLW9	1
