PREFACE

This Engineer's Manual is written for the technical personnel who are responsible for the service and maintenance of the machine. The Instruction Manual for these machines intended for the maintenance personnel and operators at an apparel factory contains operating instructions in detail. And this manual describes "Standard Adjustment", "Adjustment Procedures", "Results of Im proper Adjustment", and other important information which are not covered by the Instruction Manual.

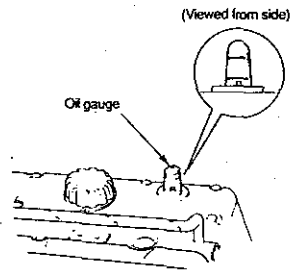

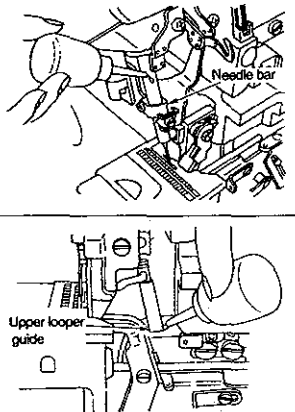

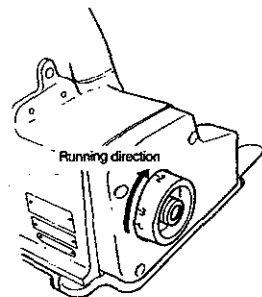

It is advisable to use the relevant Instruction Manual and Parts List together with this Engineer's Manual when carrying out the maintenance of these machines.

CAUTIONS

 <p>1. Do not put your hand under the needle when you turn on the power switch.</p>	 <p>2. Do not put your hand into the face plate section while the machine is running.</p>	 <p>3. Be sure to turn off the power switch before you remove the V-belt.</p>
 <p>4. Never bring your fingers or hair close to, or place anything on the handwheel, V-belt, bobbin winder wheel or motor during operation. It may lead to serious personal injuries.</p>	 <p>5. If your machine is provided with a belt cover, finger guard and eye guard, never operate your machine with any of them removed.</p>	
<p>6. Do not wipe the surface of the machine head with lacquer thinner.</p>		

7. If your machine is equipped with a clutch type motor, the motor will be kept running by inertia after turning OFF the power switch. It is dangerous to depress the foot pedal of the sewing machine while the motor is still running, because the sewing machine will start rotating abruptly. Be sure to keep the foot pedal of the sewing machine held depressed after turning OFF the power switch until the sewing machine completely stops.
8. When you leave from your machine, make sure to turn OFF the power to it.
9. In case of a power failure, make sure to turn OFF the power to the machine.

BEFORE OPERATION

 <p>(Viewed from side)</p> <p>Oil gauge</p> <p>1. If the pointer bar of the oil gauge comes down under the lower marker line when observing the oil gauge from sideward, supply oil referring to the description of "5. Lubrication."</p>	 <p>Needle bar</p> <p>Upper looper guide</p> <p>2. Apply two or three drops of oil to the needle bar and upper looper guide when operating the machine for the first time after setup or after a long period of disuse.</p>	 <p>Running direction</p> <p>3. The correct machine running direction is such that the handwheel turns clockwise as viewed from the handwheel's side. Never run the machine in the reverse direction.</p>

3. STANDARD ADJUSTMENT (FOR MAIN UNIT)

STANDARD ADJUSTMENT

(1) Adjusting the needle height

When the needle(s) is in the highest position the distance between the needle point(s) and the throat plate surface should be as shown below.

SP	151/161
Refer to right Fig.	
SP	172
Refer to right Fig.	

SP161S800
SP161H

Model	Left needle	Right needle
SP151H	10.0(0.394")	—
SP161S△△△△△△△△C	10.5(0.413")	—
SP161SM048C	11(0.433")	—
SP172S△△△M△△△	10.5(0.413")	9.1(0.358")
SP172S△△△H△△△	11(0.433")	9.6(0.378")

The adjustment of needle height for the 2-needle overlock machine should be made in reference to the left needle.

(2) Positioning the throat plate

The needle entry point should be such that the distance between the needle slot edge of the throat plate and the needle center.

Overlock side A	1.3(0.051")	(Unit: mm)
-----------------	-------------	------------

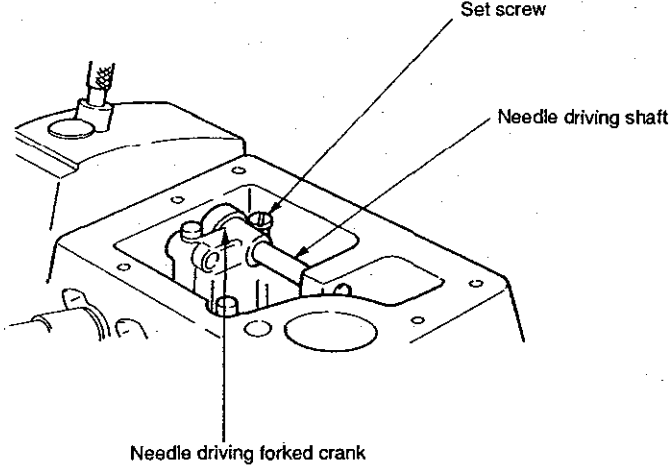

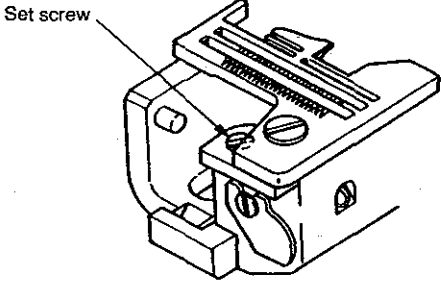

(3) Installing position of the needle clamp

The needle clamp connecting stud should fit with the bottom end of the needle bar or spaced 0.5 mm (0.20") or less from it.

Butt the needle clamp with the bottom end of the needle bar.

ADJUSTMENT PROCEDURES	RESULTS OF IMPROPER ADJUSTMENT
<ul style="list-style-type: none"> Take off the upper cover, and loosen the set screw of the needle driving forked crank to perform the adjustment of the needle height.  <p style="text-align: center;">Needle driving forked crank</p> <p>(Caution) Do not fully loosen the set screw of the needle driving forked crank. If the needle driving forked crank has got out of position laterally when its set screw was loosened, fully loosen the set screw and turn pulley to allow the forked crank to turn until it settles by itself. Then tighten the set screw to fix the forked crank at that position.</p>	<ul style="list-style-type: none"> Any other needle height than specified here will badly affect the action of the lower looper, the timing for catching the upper looper thread, etc. Improper lateral position of the needle driving forked crank will cause seizure, play, or other troubles.
<ul style="list-style-type: none"> Loosen the set screws of the throat plate base to make the adjustment.  <p style="text-align: center;">Set screw</p>	<ul style="list-style-type: none"> Improperly positioned throat plate will cause needle breakage, contact of the needles with the throat plate, or other troubles.
<ul style="list-style-type: none"> Loosen the screw and adjust, by slightly turning the needle clamp, the clearance provided between the right-hand side needle and the lower looper (for 2-needle overlock machine). 	<ul style="list-style-type: none"> If the clearance provided between the needle and the looper is excessive, the needle thread will be likely to skip at the time of tucking. If the clearance provided between the needle and the looper is insufficient, the needle will break or the looper blade point will be damaged causing thread breakage.

STANDARD ADJUSTMENT

(4) Adjusting the lower looper

1) Looper gauge of the lower looper

The distance between the blade point of the lower looper and the center of the needle should be as follows when the lower looper is at the extreme left of its stroke.

Model		Looper gauge of the lower looper
1-needle overlock machine	SP151 SP161H SP161S	4.0 ± 0.3 ($0.157 \pm 0.012''$)
	SP161S800M048C SP161S900M032C SP161S900M040C	3.6 ± 0.3 ($0.142 \pm 0.012''$)
	SP172S△△M△△ SP172S△△△H△△	3.6 ± 0.3 ($0.142 \pm 0.012''$) 4 ± 0.3 ($0.157 \pm 0.012''$)

2) Clearance between the lower looper and the needle

The clearance should be 0 to 0.1 mm. (.004")

0 ~ 0.1 mm / 0 ~ .004"

ADJUSTMENT PROCEDURES	RESULTS OF IMPROPER ADJUSTMENT
<ul style="list-style-type: none"> ○ Loosen the set screw of the lower looper support arm to make adjustment of the returning amount of the lower looper. <p>(Referential information)</p> <ol style="list-style-type: none"> 1. The radius of the lower looper will be 67.4 mm (2.654±.008") when the lower looper is inserted into the support arm until it contacts the stop pin and then fixed. 2. The rocking angle of the lower looper will be 27°. 	<ul style="list-style-type: none"> ○ Excessive return of the lower looper tends to cause stitch skipping when filament thread is used. ○ Insufficient return of the lower looper tends to cause needle thread stitch skipping when mixed yarn is used.
<ul style="list-style-type: none"> ○ Loosen the screw in the lower looper supporting arm until it is temporarily tightened. Then, finely adjust the longitudinal position of the looper using the fine adjustment screw. <div style="border: 1px solid black; padding: 5px; margin: 10px 0;"> <p>Turn the fine-adjusting screw clockwise to move the lower looper closer to the needle.</p> <p>Turn it counterclockwise to move the lower looper away from the needle.</p> </div>	<ul style="list-style-type: none"> ○ Excessive clearance will often cause needle thread stitch skipping. ○ Insufficient clearance will cause needle breakage due to the contact of the looper with the needle, or produce scratches on the blade point of the looper, leading to needle thread breakage or other troubles.

STANDARD ADJUSTMENT

(5) Position of the upper looper guide

Vertical position: To be in close contact with the frame guide surface.

Lateral position: To be pressed against the upper looper guide support gauge.

Upper looper guide support gauge	5.5 7(0.276") (0.217")	5(0.217") 6.5(0.256")
11831807		11893609

Model		Position of guide support
1-needle overlock machine	SP-151 SP-161H SP-161S	7(0.276")
	SP161S900M048C	6.5(0.256")
2-needle overlock machine	SP172S△△M△△△	7(0.276")
	SP172S△△H△△△	6.5(0.256")

(6) Positioning the upper looper holder

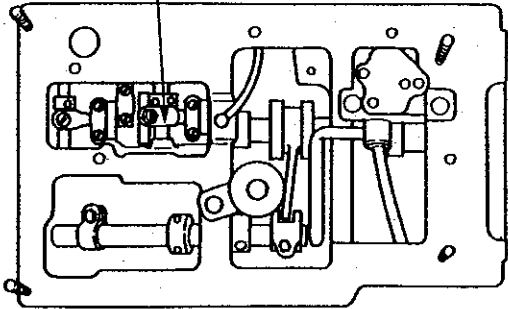

The distance between the bottom surface of the frame and the upper end of the upper looper holder pin should be as shown below when the upper looper holder is at the highest point of its stroke.

Model	Dimension (E)
SP151/161	44.85±0.05 mm (1.766"±0.002")
SP172	47.15±0.05 mm (1.856"±0.002")

For models other than standard models

Model	Dimension (E)
SP151 SP161H SP161S	44.85±0.05 (1.766"±0.002")
SP161S800M048C SP161S900M032C SP161S900M040C	47.15±0.05 (1.856"±0.002")
SP172S△△△M△△△	47.15±0.05 (1.856"±0.002")
SP172S△△△H△△△	48.15±0.05 (1.766"±0.002")

ADJUSTMENT PROCEDURES	RESULTS OF IMPROPER ADJUSTMENT
<ul style="list-style-type: none"> ○ Fit the upper looper guide supporting gauge over the gauge fixing pin which has been driven in the frame and secure the gauge with an O ring. Then position the gauge taking the marker dot engraved on it or the chamfering direction as reference. ○ When installing the upper looper guide, press it against the gauge while keeping the upper looper guide into close contact with the frame surface, then tighten the screws. 	<ul style="list-style-type: none"> ○ If the upper looper guide has improperly positioned vertically, it will cause oil leakage or disturbed path of the upper looper with resultant stitch skipping. ○ If the upper looper guide has been inaccurately positioned laterally, it will cause stitch skipping, or contact with the looper.
<p><Adjustment order></p> <ol style="list-style-type: none"> 1) Loosen the setscrew of the upper looper ball arm. 2) Determine the dimension from the bottom of the frame to the upper looper arm pin, then tighten the screw in the upper looper ball arm. <p>(Caution) If the screw in the upper looper arm has been loosened to replace the upper looper connection, tighten the screw in the upper looper arm at the position where the upper looper arm smoothly moves when it is moved slightly beyond the momentum of the upper looper connection with the upper looper ball arm loosened. (Confirm that the upper looper smoothly moves together with the shaft.)</p> <p style="text-align: center;">Upper looper ball arm</p> 	<ul style="list-style-type: none"> ○ Inaccurately positioned upper looper holder will cause excessive projection of the upper looper, resulting in stitch skipping, or other troubles. ○ If the upper looper ball arm has been improperly positioned longitudinally, seizure will result (mainly because the arm sticks when it goes up). <p>(Caution) To adjust the upper looper ball arm, take dimension E as standard. Remember that the projecting amount and the height of the upper looper should eventually be properly adjusted. So, confirm the dimensions related to the upper looper.</p>

STANDARD ADJUSTMENT

(7) Positioning the upper looper

1) Height of the upper looper

The distance between the throat plate surface and the blade point of the looper should be as follows when the upper looper is at the extreme left of its travel.

① SP100	Standard		
SP151H	10.7±0.3 mm	(0.421"±0.012")	
SP161H	10.7±0.3 mm	(0.421"±0.012")	
SP161S	10.7±0.3 mm	(0.421"±0.012")	
SP172	10.9±0.3 mm	(0.429"±0.012")	

For models other than standard models

Model	Dimension (A)
SP151H SP161H SP161S	10.7±0.3 mm (0.421"±0.012")
SP161S800M048C SP161S900M032C SP161S900M040C SP172S△△△△M△△△△	10.9±0.3 mm (0.429"±0.012")
SP161S900M048C	11.0±0.3 mm
SP172S△△△△H△△△	(0.433"±0.012")

2) Longitudinal position of the upper looper

- ① The clearance between the upper and lower loopers should be 0.1 (0.004") to 0.2 mm (0.008") when they cross with each other.
- ② The clearance between the upper looper and the needle should be 0 to 0.2 mm. (0.008")

ADJUSTMENT PROCEDURES	RESULTS OF IMPROPER ADJUSTMENT
<ul style="list-style-type: none"> ◦ Set a hexagon wrench onto the set screw at the end of the upper looper bracket to adjust the height of the upper looper. When adjusting the height, pay attention also to the clearance produced between the upper looper and lower looper at the time of their crossing. 	<ul style="list-style-type: none"> ◦ If the upper looper has been positioned too high, an excessive clearance will be produced between the upper looper and the needle. As the result, the upper looper thread will fail to catch the needle thread, and stitch skipping occur. ◦ On the contrary, if the upper looper has been positioned too low, the needle point will hit the looper, causing needle breakage. Also the looper will touch other component when the presser foot goes up.
<ul style="list-style-type: none"> ◦ Loosen the set screw at the top end of the upper looper bracket to move the looper back or forth for positioning. 	<ul style="list-style-type: none"> ◦ Excessive clearance will cause stitch skipping. ◦ Insufficient clearance will cause the upper looper to come in contact with the lower looper.
<div data-bbox="532 1318 922 1564" data-label="Diagram"> <p>The diagram illustrates the adjustment mechanism. A hexagonal set screw is located on the upper looper bracket. A hexagonal wrench is shown turning this set screw. The upper looper is attached to the bracket. A vertical double-headed arrow indicates the range of height adjustment for the upper looper.</p> </div>	

STANDARD ADJUSTMENT

(8) Positioning the needle guard

1) For 1-needle or 2-needle overlock machine

The overlock machine has two needle guards, **A** and **B**.

Needle guard **A** When the blade point of the lower looper reaches the needle center:

(9) Adjusting the height of the feed dog

The height of the feed dog should be as follows when it is at its highest position.

Model	Height of the feed dog
SP100	1 mm (0.039")

The auxiliary feed dog is 0.5 mm (0.020") lower than the main feed dog.

ADJUSTMENT PROCEDURES	RESULTS OF IMPROPER ADJUSTMENT
<ul style="list-style-type: none"> ○ Adjust the clearance between the needle guard A and the needles by the set screws of the needle guard. ○ Loosen the screw and adjust the clearance provided between needle guard B and the needle by moving the needle guard back or forth. 	<ul style="list-style-type: none"> ○ Excessively close contact between the needle guard A and the needles will lead to needle bend or stitch skipping. ○ A clearance left between the needle guard A and the needles will cause the looper blade point to come in contact with the needles, leading to needle or blade point breakage, or other troubles. ○ Excessive clearance between the needle guard B and the needle will cause stitch skipping due to needle shake. On the contrary, insufficient clearance will cause the needle guards to catch the needles between them, leading to wear on the needle guards and scratches on the needles.
<ul style="list-style-type: none"> ○ Perform adjustment by the set screws. <div data-bbox="544 1276 889 1570" data-label="Image"> </div>	<ul style="list-style-type: none"> ○ If the feed dogs are too high, the needles will be deflected and broken when sewing heavy-weight materials. The feed dogs will tend to suffer scratches when sewing light-weight materials. Puckering will frequently occur. ○ If the feed dogs are too low, insufficient feed power will result. ○ If the auxiliary feed dog is too high, chain-off thread will be often jammed. ○ If the main feed dog and differential feed dog are set at different heights, proper differential feeding action will be hindered.

STANDARD ADJUSTMENT

(10) Adjusting the tilt of the feed dog

When the feed dogs have come up most, they should be flat.

When the feed dog juts out the top surface of the throat plate.

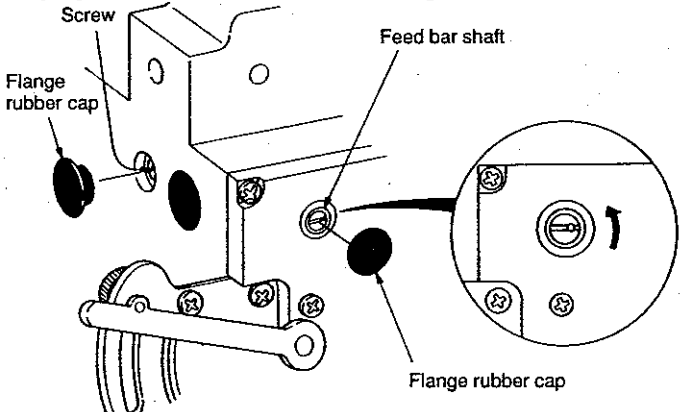

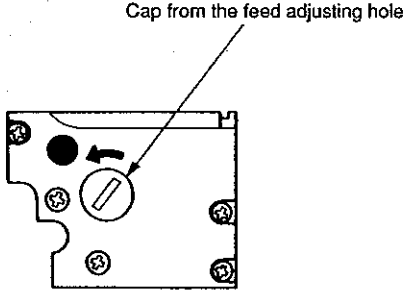

Adjust the inclination of the feed dog when it is in its highest position so that the feed dog is flush with the throat plate when the feed dog juts out the throat plate.

(11) Changing the differential feed ratio

Differential feed ratio is normally changed by the differential feed adjusting lever. If a larger differential feed ratio is required for sewing, change the position of the main feed pin.

ADJUSTMENT PROCEDURES	RESULTS OF IMPROPER ADJUSTMENT
<p>○ The feed bar shaft consists of an eccentric shaft. Loosen the set screw to perform adjustment. Remove the flange rubber cap from the rear of the machine, and loosen the screw. Remove the flange rubber cap and turn the feed bar shaft. When the slit on the shaft is leveled and the marker dot on it is positioned this side (toward the operator)..... The feed dog is leveled. When the marker dot is raised above the standard position..... The feed dog is positioned with this side, toward the operator, raised (in the direction of the arrow). When the marker dot is lowered under the standard position..... The feed dog is positioned with this side, toward the operator, lowered.</p> 	<ul style="list-style-type: none"> ○ When tilted with the front up Good material catching will be obtained. ○ When tilted with the front down Uneven feed and puckering will be effectively prevented.
<p>○ Remove the cap from the feed adjusting hole located on the left-hand side face of the frame. Then, loosen the screw in the main feed pin and adjust the position of the main feed pin. When the pin is set at its highest position..... Standard When the pin is set at its lowest position..... Max. gathering is obtained.</p> 	

STANDARD ADJUSTMENT

(12) Longitudinal position of the feed bar

When the feed pitch is maximized and the differential feed ratio is also maximized, the front and rear ends of the feed dog should be spaced approximately 0.5 mm away from the corresponding edges of the slot in the throat plate.

ADJUSTMENT PROCEDURES

- Remove the oil reservoir. Loosen the clamping screws in the feed connection crank and differential feed arm and adjust the feed bars.
- 1) To adjust only the differential feed bar, loosen the differential feed arm clamping screw. Then perform the adjustment.
- 2) To adjust only the main feed bar, loosen the feed connection crank clamping screw. Then perform the adjustment.
When the main feed bar is adjusted, the differential feed bar also moves out of position. So, after you have adjusted the main feed bar, loosen the clamping screw in the differential feed bar and properly adjust the position of the differential feed bar.
- 3) To adjust both the main feed bar and the differential feed bar, adjust first the main feed bar, then adjust the differential feed bar.

RESULTS OF IMPROPER ADJUSTMENT

- If the clearance provided between the throat plate and the feed dog is too small, they will come in contact with each other when the sewing machine runs at high speed.

STANDARD ADJUSTMENT

(13) Positioning the presser foot

The presser foot should be positioned so that the feed dogs go down under the specified presser foot pressure, and the presser foot sole comes in contact evenly with the throat plate surface.

(14) Positioning the upper knife arm shaft

The upper knife shaft should be positioned 34 mm (1.339") above the top surface of the throat plate when it is at its highest position.

(15) Positioning the upper and lower knives, and available overedge widths

1) Lower knife

The vertical position of the lower knife should be adjusted to make its blade top end flush with the throat plate top surface. The lateral positioning should be done in accordance with a desired overedging width.

2) Upper knife

The upper knife should be positioned vertically so that it engages with the lower knife 0.5(0.020") to 1 mm (0.039") when the upper knife is at the lowest point of its travel.

The lateral positioning should be done in accordance with a desired overedging width.

3) Overedging width

Overedging widths from 2 (0.079") to 4.8 mm (0.189") are obtainable by replacing the components or by using subclass machines.

ADJUSTMENT PROCEDURES	RESULTS OF IMPROPER ADJUSTMENT
<ul style="list-style-type: none"> ○ Loosen the set screw, and perform adjustment so that the presser foot bottom comes in contact evenly with the throat plate top surface. Accurate adjustment can be made by using two pieces of thin paper to check for even drawing-out tension. ○ Even contact of the presser foot with the throat plate top surface is achieved rather easily by tightening the screw while pushing the right side of the presser foot downward. 	<ul style="list-style-type: none"> ○ Uneven contact will result in bad straight material feed, weak feed power, or puckering.
<ul style="list-style-type: none"> ○ Removing the upper cover, loosen the set screws of the upper knife driving arm, and turn the upper knife shaft to perform vertical positioning. <p>(Caution) Be sure to fully tighten the set screws since the knife shaft is subjected to high loads.</p>	<ul style="list-style-type: none"> ○ Improperly positioned upper knife arm shaft will come in contact with the frame. If it is moved with the position of the upper knife unchanged, proper engagement of the knives will be disturbed, prohibiting sharp cutting of the knives.
<ul style="list-style-type: none"> ○ Lower knife Loosen screw ② and adjust so that the top edge of the knife ① is aligned with the top surface of the throat plate. ○ Upper knife Loosen screw ④ and adjust so that the upper knife overlaps the lower knife ① by 0.5 to 1 mm when upper knife ③ comes down to the lowest point of its stroke. ○ Overedging width Loosen screw ⑤, and fix lower knife ① while pressing it to the left. Loosen screw ⑥, and move upper knife ③ until the specified position is reached. Then, fix upper knife ③ there. Bring the upper knife to the lowest position and loosen screw ⑥. Move the lower knife until it comes in contact with the upper knife, then tighten screw ⑤. <p>(Caution)</p> <ol style="list-style-type: none"> 1. If the lower knife is used, be sure to tighten screw ⑤. 2. After the adjustment, check the sharpness of the knives by cutting a single strand of thread at the front and rear of cutting surface. 	<ul style="list-style-type: none"> ○ The lower knife, if positioned too high, will catch materials or cause no contact of the presser foot with the throat plate top surface. ○ If the lower knife is positioned too low, the cutting width will be changed or materials will be caught by the lower knife. ○ The upper knife, if positioned too high, will fail to cut materials. ○ Unsharp cutting or abnormal wear on the knives will result unless the lower knife is laterally positioned and fixed at a position where it has settled by itself under the upper knife spring.

STANDARD ADJUSTMENT

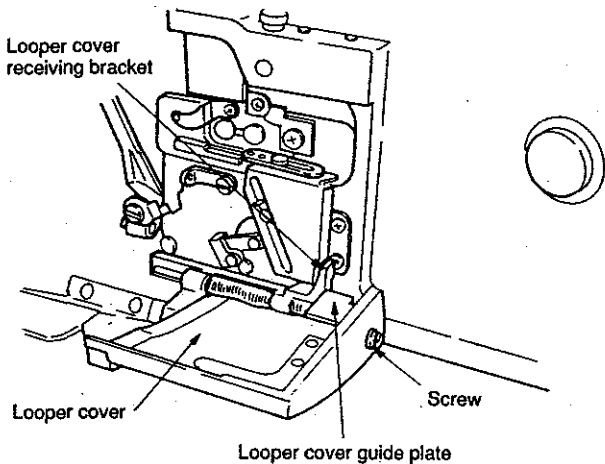

(16) Resharpener of the knife

(17) Adjusting the looper cover

- The looper cover should smoothly close when slowly closing the looper cover with the upper knife in the lowest position of its stroke.

ADJUSTMENT PROCEDURES	RESULTS OF IMPROPER ADJUSTMENT
<ul style="list-style-type: none"> ○ When the lower knife has become dull, fully sharpen it. ○ In principle, no resharpener of the upper knife is done. When the upper knife has become dull, replace it. (This is because the upper knife is a serrated carbide knife.) 	<ul style="list-style-type: none"> ○ If the 15° angle of the lower knife is exceeded, the durability of the knife will be deteriorated, often resulting in blade chipping. ○ If the angle is smaller than 15°, the knife will be dull. ○ If the 62° angle is not observed, the knife may catch materials.
<ul style="list-style-type: none"> ○ Close the looper cover, loosen the screw, and move the looper cover guide plate back and forth until the looper cover is brought to a position where the cover smoothly closes. <p style="text-align: center;"> { Move the looper cover guide plate until it slightly comes in contact with the looper cover receiving bracket. Now, fix the guide plate by tightening the screw. </p> 	

STANDARD ADJUSTMENT

(18) Adjusting the cloth chip cover

- When the cloth chip cover is pressed away from you, it should not rattle.
In addition, the cloth chip cover should not come in contact with the upper knife nor the lower looper.

ADJUSTMENT PROCEDURES	RESULTS OF IMPROPER ADJUSTMENT
<ul style="list-style-type: none">◦ Temporarily tighten the screw with the cloth chip cover stop raised.◦ Loosen the screw in the cloth chip cover, and adjust the longitudinal position of the cloth chip cover.◦ Loosen the screw in the cloth chip cover stop again, and press the cloth chip cover stop downward until the stop slightly comes in contact with the looper cover. Now, tighten the screw.◦ Finally, confirm that the cloth chip cover comes in contact with neither the upper knife nor the looper.	

STANDARD ADJUSTMENT

(19) Adjusting the needle mechanism

- The oil wick in the needle drive connecting pin should be flush with the chamfered plane of the pin. (If the oil wick sinks inside the chamfered plane, oil will not be fed smoothly.)
- Assemble the needle drive connecting link components so that the portion equipped with a boss comes outside. In addition, the rib located at the center of the link should face upward.

- A clearance of 0.1 mm (0.004") should be provided between the needle lubricating pin and the needle drive connecting link. (Assemble them using a 0.1 mm (0.004") spacer.)
- Install the oil lubricating pin in place with its oil inlet faced above.

ADJUSTMENT PROCEDURES

- Remove the top cover, side cover and brand label.
- Remove the rubber plug located under the brand label.
- If the top cover gasket has been adhered to the frame, also remove the gasket.
- Loosen the screw in the needle lubricating pin, and remove the pin.

- Loosen the screw in the needle drive connecting link .
- Fitting the needle drive connecting link pin in the hole in the frame, thrust the pin until it can be drawn out.

RESULTS OF IMPROPER ADJUSTMENT

- If the oil wick is installed in the needle drive connecting link pin inside the pin as , oil will not be lubricated properly resulting in seizure.

- If the clearance provided between the needle lubricating pin and the needle drive connecting link is too small, the related components will come in contact with each other.
- If the clearance provided between the needle lubricating pin and the needle drive connecting link is too large, oil will not be fed properly resulting in seizure.
- If the oil inlet does not face upward, oil will not be fed resulting in seizure.

STANDARD ADJUSTMENT

(20) Position of the upper looper lubricating pin

1) Orientation of the lubricating pin

The oil inlet of the upper looper lubricating pin should face upward.

2) Setting the lubricating pin

Set the lubricating pin in position so that a clearance of 0.1 mm is provided between the upper looper lubricating pin and the upper looper bracket.

ADJUSTMENT PROCEDURES

- When the upper looper lubricating pin is set in place with the oil inlet faced upward, the lubricating hole is in the lower section as observed from this side.

- Remove the oil reservoir, loosen the screw and adjust the position of the upper looper lubricating pin. Adjust the clearance provided between the upper looper lubricating pin and the upper looper bracket using a 0.1 mm spacer.

RESULTS OF IMPROPER ADJUSTMENT

- If the oil inlet does not face upward, oil will not be fed resulting in seizure.
- If the clearance provided between the upper looper lubricating pin and the upper looper bracket is too small, the related components will come in contact with each other.
- If the clearance provided between the upper looper lubricating pin and the upper looper bracket is too large, oil will not be fed resulting in seizure.

STANDARD ADJUSTMENT

(21) Position of the thread guides and the looper thread take-ups

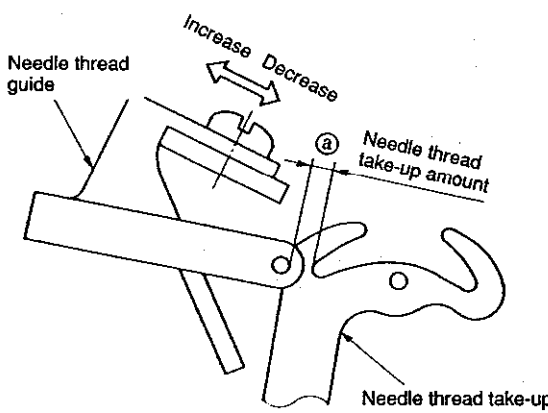

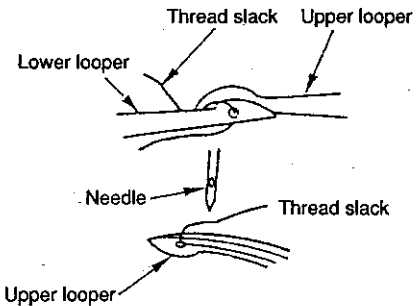

When the needle thread take-up lever is in its lowest dead point, shift the hook of the thread take-up lever from the thread hole in the needle thread guide by the distance equivalent to 1/3 of the diameter of the hole.

When the needle thread take-up lever is in its lowest dead point, shift the hook of the thread take-up lever from the thread hole in the needle thread guide by the distance equivalent to 1/3 of the diameter of the hole.

Required adjustment values when the upper looper is at its fully retracted position

Symbol	SP161S (Standard)		SP172 (Standard)		SP151H, SP161H (Bling hemming)	
	General thread	Wooly thread	General thread	Wooly thread	General thread	Wooly thread
A	15.8 (0.622")	←	←	←	←	←
B	4 (0.157")	←	←	←	←	←
E	13.5 (0.531")	←	←	←	←	←
F	Level	←	←	←	←	←
G	15 (0.591")	←	←	←	←	←

ADJUSTMENT PROCEDURES	RESULTS OF IMPROPER ADJUSTMENT
<p>○ Perform the adjustment by the set screws.</p>  <p>○ Distance J is related to the vertical intersecting point of the upper and lower looper threads. Set this distance larger for wooly thread, and set smaller for thin thread which is likely to cause stitch skipping.</p> <p>○ It is desirable to set distance K larger for stretchy threads such as wooly thread.</p> <p>○ Set distance L a little larger when making blind hemming soft chain stitches.</p> <p>○ Set distance N a little smaller for blind hemming or making soft chain stitches.</p> <p>○ Set distance O larger if stitch skipping occurs due to looper thread slack. Set it smaller for better appearance and touch of produced stitches when wooly thread is used.</p> 	<p>○ Distance a</p> <p>When set smaller, better tightness of needle thread stitches will be obtained.</p> <p>When set larger, loose needle thread stitches will result.</p> <p>○ Distance E, F and H exert least influence on stitch formation, however, improper setting of these distances will cause contact between the moving parts.</p> <p>○ Distance J</p> <p>When set larger, the amount of the upper looper thread will be increased.</p> <p>When set smaller, the amount of the upper looper thread will be decreased.</p> <p>○ Distance K</p> <p>When set larger, the amount of the upper looper thread will be increased.</p> <p>When set smaller, the amount of the upper looper thread will be decreased.</p> <p>○ Distance L</p> <p>When set larger, the amount of the lower looper thread will be decreased.</p> <p>When set smaller, the amount of the lower looper thread will be increased.</p> <p>○ Distance N</p> <p>When set larger, the amount of the lower looper thread will be increased.</p> <p>When set smaller, the amount of the lower looper thread will be decreased.</p> <p>○ Distance O</p> <p>When set larger, the amount of the upper and lower looper threads will be decreased.</p> <p>When set smaller, the amount of the upper and lower looper threads will be increased.</p>

4. ADDITIONAL INFORMATION AND PRECAUTIONS

(1) Thread tension

1) Strength of tension spring and height of tension adjusting nut

Part No.	Color	Natural length	Operating length	Weight required to compress spring to working length	Height A of nut when "0" is set on the scale
115-50100	Purple	19.5mm (0.768")	11.5mm (0.453")	910±50g	54.4±0.5mm (2.142"±0.020")
115-50209	Green	19.5 (0.768")	11.5 (0.453")	640±50	54.4±0.5 (2.142"±0.020")
B3101-804-000	Red	19.5 (0.768")	11.5 (0.453")	430±50	54.4±0.5 (2.142"±0.020")
B3102-804-000	Yellow	17.8 (0.701")	9.8 (0.386")	320±35	52.7±0.5 (2.075"±0.020")
B3103-804-000	Blue	17.3 (0.681")	9.3 (0.366")	150±20	52.2±0.5 (2.055"±0.020")
B3121-804-000	Gray	13.8 (0.543")	5.8 (0.228")	150±20	48.7±0.5 (1.917"±0.020")

2) How to replace the tension spring and set "0" on the scale

- ① Remove the tension adjusting nut, scale shaft pin and spring bush, then replace the pin with the exclusive one. When the knob is removed, the scale pin will come off. So, be careful.
- ② Attach the spring bush and the scale shaft pin in place and screw in the tension adjusting nut. At this time, screw in the knob after aligning the axial direction of the scale shaft pin and the longitudinal direction of the groove inside the knob.
- ③ Adjust the height of the end face of the knob (dimension A) as measured from the thread guide plate to the value given in the table above.
- ④ Remove the screw from the thread guide plate. At this time, the scale case and the gear inside the case will come off if the scale case is faced downward. So, be sure to remove the screw from the thread guide plate keeping the scale case held faced upward.
- ⑤ Remove the scale case. Remove the double gear. The scale gear freely rotates. So, position the 0 mark hole straight up. Now, fit the double gear over the scale gear.
- ⑥ Fit the scale case over the double gear and fix the case with a locknut.

3) Springs used for each model

Model \ Where to use	Needle thread	Upper looper thread	Lower looper thread
SP151H	Blue	—	Yellow
SP161S	Red	Yellow	Blue
SP161H	Yellow	Blue	Yellow
SP172	Red, Yellow	Yellow	Blue

(2) Upper looper of the SP 100

Use a proper upper looper in accordance with the needle No. When ordering, specify the boxed numbers shown in the table at right. The loopers with asterisks will be attached to standard machine heads.

Model	Nos. engraved on upper looper	Needle No.	Upper looper thickness A
SP151	* 1224 75	#9 #11 #14	2.05 (0.081")
SP161	* 1224 73	#9 #11 #14	2.05 (0.081")
SP172	* 1224 73	#9 #11 #14	2.05 (0.081")
SP161S900M048C	* 1224 71	#9 #11 #14	2.25 (0.089")
SP172S900HAC	1224 73	#14 #16 #18	2.05 (0.081")
SP172S900HAD			
SP172S900HAE			
SP172S900HBD			
SP172S900HBE			

(3) Center-to-center distance of the upper looper holder

The standard center-to-center distances are as shown below.

For models other than standard

Model	Center-to-center
SP151H SP161H SP161S800M032 SP161S800M040	39 (1.535")
SP161S800M048C SP161S900M032C SP161S900M040C SP161S900M048C SP172S	41 (1.614")

SP151 — 39 mm (1.535")
SP161 — 39 mm (1.535")

SP172 — 41 mm (1.614")

(4) Caution in assembly

1) Application of sealant

① Bottom surface of the upper looper guide support (Three-bond TB1102)

Apply the sealant to the bottom surface of the upper looper guide support, which contacts with the frame surface.

② Apply sealing compound (THREE BOND TB 1104) to four screws, i.e., two screws in the rubber cushion case and two screws in the feed bar.

- ③ Oil shield plate assembly (THREE BOND TB 1104)
Apply the sealant to the inside of the oil shield plate.

- ④ Feed cover packings (THREE BOND 1212)
Fit feed cover packings A and B in the feed cover.
Apply sealing compound (THREE BOND 1212) to the packings.

2) Precautions to be taken with respect to the lubricating components

① Feed bar components

- Carefully check the orientation of the rubber cushion.

* If the oil shield rubber pieces are assembled as illustrated above, oil leakage will result. So, carefully assemble them.

② Upper looper guide components

- Cut both ends of the oil wick inside the upper looper connecting pin so that they are flush with the pin ends taking care not to allow the oil wick ends to protrude the pin ends.

- Oil is fed to the upper looper lubricating felt through the oil wicks installed inside the frame. The oil wicks should not be longer than the required length.

So, carefully check the oil wick length.

One oil wick should be 10 (0.394") mm from the inside of the frame. The turned-up section of the oil wick should be flush with the frame end. Another oil wick should come in contact with the lubricating felt.

- Set the upper looper lubricating felt so that it projects 4 mm from the upper looper guide support as illustrated in the figure and confirm that the upper looper bracket comes in contact with the top of the felt.

(5) Kinds of motor pulleys, belts and frame support plate bolts

1) Motor pulleys and belts (for SP type machines)

Sewing speed of sewing machine (s.p.m.)	50Hz			60Hz		
	Outside diameter of motor pulley (mm)	Semi-sunken type (inch)	Fully-sunken type (inch)	Outside diameter of motor pulley (mm)	Semi-sunken type (inch)	Fully-sunken type (inch)
8500	160.5 (6.319")	40	36	135.5 (5.335")	38	34
8000	150.5 (5.925")	40	34	125.5 (4.941")	38	32
7500	140.5 (5.531")	38	34	120.5 (4.744")	38	32
7000	130.5 (5.138")	38	34	110.5 (4.350")	36	32
6500	120.5 (4.744")	38	32	100.5 (3.957")	36	32
6000	110.5 (4.350")	36	32	95.5 (3.563")	35	30
5500	100.5 (3.957")	36	32	85.5 (3.366")	35	30
5000	90.5 (3.563")	35	30	80.5 (3.169")	34	30
4500	85.5 (3.366")	35	30	70.5 (2.776")	34	30
4000	75.5 (2.972")	34	30	60.5 (2.382")	34	29

- * Use a motor of 3/4 HP (550 W) when the sewing machine runs at 7,500 s.p.m or higher speed.
Use a motor of 1/2 HP (400 W) when the sewing machine runs at a speed lower than 7,500 s.p.m.
- o Be sure to use the motor of which speed does not exceed the sewing speed of the sewing machine.

*** Part No. of motor pulley**

MTKP0XXX000 (Enter the effective diameter to "XXX.")
 If the outside diameter of the motor pulley is 150.5 mm, enter "145" to "XXX". So, the part No. will be MTKP0145000.
 If the outside diameter of the motor pulley is 90.5 mm, enter "085" to "XXX". So, the part No. will be MTKP0085000.

*** Part No. of belt**

MTJVM00XX00 (Enter a number that shows the belt length to "XX.")
 If the belt length is 40 inches, enter "40" to "XX." So, the part No. will be MTJVM004000.
 If the belt length is 35 inches, enter "35" to "XX." So, the part No. will be MTJVM003500.

2) Pat No. of frame support plate bolt

- ② Semi-sunken type frame support plate (A) asm. requires four bolts.
Support plate bolt (A) asm. 119-66751

{	Support plate bolt (A)	119-66702 x 1
	Locknut	NS6240630SN x 1
	Washer	WP1102016SC x 1
	Spring washer	WS1002560KR x 1

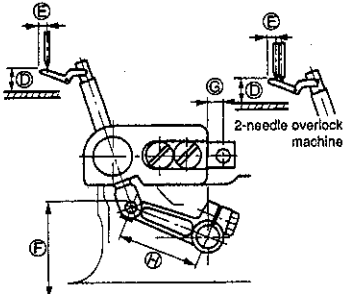

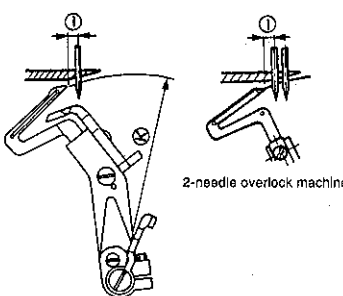

Separately from the aforementioned bolts, support plate (B) (115-71700) is available.

Difference of support plate bolts (A) and (B)
 Entire length under the neck and length of threaded part

	Entire length (mm)	Length of threaded part (mm)
Bolt (A)	69 (2.717")	39 (1.535")
Bolt (B)	125 (4.921")	95 (3.740")

5. ADJUSTMENT OF THE NEEDLE HEIGHT AND LOOPER FITTING (SP100 SERIES)

Needle height	1-needle overlock machine 	2-needle overlock machine 	Class/location Subclass	Description		Needle height		Upper looper components					Lower looper components	
				1-needle 2-needle (left)	2-needle (right)	Upper looper height	Projection of upper looper	Height of pin asm	Position of guide support	Center-to-center of looper holder	Returning amount of lower looper	Radius of lower looper		
						(A) (B)	(C)	(D)	(E)	(F)	(G)	(H)	(I)	(K)
Upper looper components 	1-needle overlock machine		SP151H SP161H									39 (1.535")	4 (0.157")	67.4 (2.654")
	1-needle overlock machine		SP161S800M032 SP161S800M040			10 (0.394")	—	10.7 (0.421")	4 (0.157")	44.85 (1.766")		41 (1.614")	3.6 (0.142")	67.4 (2.654")
	2-needle overlock machine		SP161S800M048C SP161S900M032C SP161S900M040C			10.5 (0.413")	—	10.9 (0.429")	4.4 (0.173")	47.15 (1.856")		41 (1.614")	3.6 (0.142")	67.4 (2.654")
Lower looper components 	2-needle overlock machine		SP161S900M048C			11 (0.433")	—	11 (0.433")	4.8 (0.189")	48.15 (1.896")		41 (1.614")	4 (0.157")	67.4 (2.654")
	2-needle overlock machine		SP172S800M SP172S900M			10.5 (0.413")	9.1 (0.358")	10.9 (0.429")	4.4 (0.173")	47.15 (1.856")		41 (1.614")	3.6 (0.142")	67.4 (2.654")
			SP172S900H			11 (0.433")	9.6 (0.378")	11 (0.433")	4.8 (0.173")	48.15 (1.896")		41 (1.614")	4 (0.157")	67.4 (2.654")

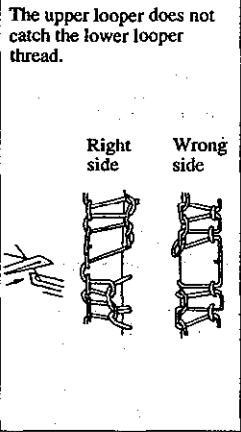

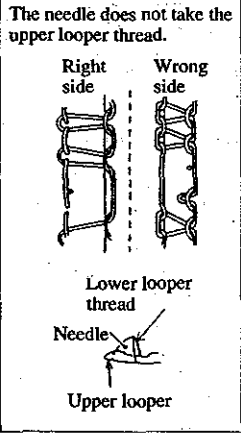

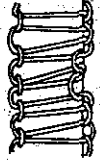

6. TROUBLES AND CORRECTIVE MEASURES

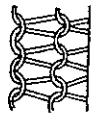

Trouble	Case (1)	Case (2)	Check and Corrective measures
1. Needle thread breakage	Threading	The thread is entangled with the thread guide, or the machine head has been incorrectly threaded.	Refer to the threading diagram.
	Thread path	If needle hole area and pawl of throat plate, stitch tongue, lower looper, needle thread take-up lever, needle thread presser plate, thread guide or tension disk have scratches, burrs and rust, a resistance will result.	Remove such scratches, burrs, etc. and perform thread path finishing. Replace major components such as looper, which have been deformed, causing thread breakage.
	Needle guard	The needle hits the needle guard intensely, and sharp edges are produced on them, causing thread breakage.	Replace the needle and needle guard if they have worn.
	Needle	The needle is too thin for the thread.	Replace the needle by a proper one.
	Needle heat	The needle gets very hot, depending on the type of materials, number of plies and sewing speed, and causes the thread to burn and break.	Use a thinner needle. Reduce the sewing speed. Use the needle cooler. Use an S-point needle or needle for synthetic thread.
	Thread	The thread is weak because of its poor quality.	Replace the thread by one with good quality.
	Thread tension	The thread tension is too high.	Lower the thread tension. Check whether the needle thread guide goes too far resulting in a higher thread tension.
	Contact	The lower looper has been improperly positioned and strikes the feed dog or throat plate.	Properly position the double chain looper or lower looper.
	Threading	The thread is entangled with the thread guide, or the looper has been incorrectly threaded.	Refer to the threading diagram.
2. Looper thread breakage	Thread path	Scratches, burrs, rust, etc. on the pawl of the throat plate, stitch tongue, looper, looper thread take-up, thread guide, or tension discs causes friction.	Remove such scratches, burrs, etc. and carry out thread path finishing. Replace loopers or other components which have been deformed, causing thread breakage.
	Adjustment of the looper thread take-up	The looper thread take-up or thread guide has been improperly positioned, causing excessive thread tension.	Refer to the pertinent Standard Adjustment.
	Thread tension	The looper thread tension is too high.	Reduce the tension while checking the tension balance other looper thread.
	Thread	The thread is weak because of its poor quality.	Replace the thread by one with good quality.
	Position of the thread guides.	The upper looper thread guide is too high, and the thread taking balance is disturbed, resulting in the thread breakage.	Refer to the pertinent Standard Adjustment.
	Needle heat	The needle gets hot, and the looper thread breaks when it comes in contact with the hot needle at the time of needle stop.	Refer to the clause relating to the needle heat causing needle thread breakage.

Trouble	Case (1)	Case (2)	Check and Corrective measures
3. Needle breakage	Needle entry point	The needle entry has not been correctly adjusted, and the needle strikes the throat plate or presser foot.	Correct the needle entry.
	Upper looper position	The upper looper juts out too much or it is too low.	Refer to the related Standard Adjustment.
	Contact with the looper	The needle strikes the looper, resulting in needle breakage.	Adjust the looper so that the looper does not come in contact with the needle.
	Needle guards	A needle guard has been improperly positioned, causing the needle point to strike it.	Refer to the pertinent Standard Adjustment.
	Needle count	The needle is too thin for the materials.	Replace the needle with a thicker one.
	Thread tension	The thread tension is too high.	Reduce the thread tension.
	Height of the feed dog or needle	The feed dog is too high, or the needle is too low, causing the needle to deflect with resultant needle breakage.	Refer to the related Standard Adjustment.
4. Overlocking needle thread stitches are skipped.	Lower looper	The blade point has defective shape and does not catch needle thread loops.	Replace the lower looper.
	Adjustment of the loopers.	The clearance or the amount of return is not correct.	Refer to the relevant Standard Adjustment.
	Needle thread presser	Presser plate which presses the needle thread fails to move smoothly. In this case, loops fail to be made with consistency.	If the needle thread presser has been deformed by correction or the like, replace it with a new one.
	Needle	The needle is bent or improperly oriented. A needle or DC x 1 is used.	Replace the bent needle. Correctly orient and attach the needle DC x 27. Use a DC x J27 needle for a stretchy thread.
	Needle guards	Incorrect height or clearance prohibits correct guide for the needle. If a needle guard is too high, loops are crushed with consequent stitch skipping.	Refer to the pertinent Standard Adjustment.
	Height of needle	The needle has incorrect height and does not properly catch up loops even if the looper has a correct return.	Refer to the related Standard Adjustment.
	Needle heat	Stitch skipping occurs before the thread breaks due to needle heat.	Refer to the clause relating to the needle thread breakage due to needle heat.
	Positioning of the needle thread guide.	If the needle thread guide has been installed at the position beyond the correct position, thread take-up amount will be excessive, making small thread loops.	Refer to the pertinent Standard Adjustment.
	Threading	The thread has been entangled with a thread guide. Threading has not been correctly done.	See the threading diagram.

Trouble	Case (1)	Case (2)	Check and Corrective measures
<p>5. Lower looper stitches are skipped.</p> <p>The upper looper does not catch the lower looper thread.</p> 	Upper looper	The blade point has a bad shape, and fails to catch the loops.	Replace the upper looper with badly deformed blade point.
	Lower looper	The clearance between the needle and the back of lower looper are not correct.	Replace the lower looper having a deformed tip.
	Adjustment of the loopers.	The feed amount of the lower looper, height of the upper looper, or clearance produced at time of crossing of the upper and lower loopers are not correct.	Refer to the relevant Standard Adjustment.
	Thread amount	Too much lower looper thread is fed, giving slack of thread.	Slightly lower the looper thread take-up (left) (reduction in distance J). Slightly raise the looper thread take-up (right) (increase in dimension O) to decrease the amount of thread. Lower the lower looper thread guide (increase in distance L), and decrease distance N to reduce the amount of thread.
	Threading	The thread has been entangled with a thread guide. Threading has not been done correctly.	
	<p>6. Upper looper thread stitches are skipped.</p> <p>The needle does not take the upper looper thread.</p> 	Threading	The thread has been entangled with a thread guide. Threading has not been done correctly.
Needle height		The needle, if positioned too high or low, may fail to catch the upper looper thread.	Refer to the related Standard Adjustment.
Needle		The needle is bent or crushed in its point.	Replace the needle. At this time, be sure to eliminate the cause for such needle bend or needle point crush.
Adjustment of the upper looper.		The height of the blade point is not correct, making the upper looper unable to properly pass the thread to the needle. The clearance between the needle and the back of the upper looper is not correct.	Refer to the relevant Standard Adjustment.
Amount of thread		Excessive upper looper thread is fed, producing slack of thread.	 Needle Slack of thread
		Slightly raise the looper thread take-up (right) (increase in distance O) to decrease the amount of thread.	
		If the thread tension is not enough, increase it.	

Trouble	Case (1)	Case (2)	Check and Corrective measures
7. Overlocking chain-off thread is bad. (Provided that no chain-off trouble occurred when sewing operation was done with materials set on the machine.)	Position of the throat plate	The throat plate has been improperly positioned longitudinally, and chain-off thread gets in between the main feed dog and throat plate, causing defective chain-off thread.	Correct the position of the throat plate.
	Feed dog	The auxiliary feed dog is too high, and interferes with chain-off thread. The auxiliary feed dog is too low. (Lower than the main feed dog by more than 0.5 mm)	Refer to the pertinent Standard Adjustment.
		The auxiliary feed dog has scratch	Repair or replace the auxiliary feed dog.
	Adjustment of looper	Adjustment of loopers for producing chain-off thread requires higher accuracy as compared with the adjustment of them for sewing materials.	Refer to the relevant Standard Adjustment.
	Thread tension	The thread tension is too low.	Slightly increase the tension.
The needle thread tension is too high, causing damaged balance with other thread tension.		Check whether the needle thread guide has been improperly positioned (too far) and needle thread tension has become too high.	
8. Overlocking needle thread is loose.	Position of the needle thread take-up guide and needle thread guide.	They are positioned too high, and the thread take-up draws out excessive needle thread.	Refer to the pertinent Standard Adjustment.
	Thread tension	The thread tension balance has been disturbed.	Refer to the Standard Adjustment for the looper thread take-up components, and increase the tension if necessary.
	Needle	The needle is too thin for the thread used.	Replace it with a proper one.
9. Uneven overlocking stitches The knotting position of the upper and lower threads varies as shown below. <div style="text-align: center;">  </div>	Looper thread tension	The upper and lower looper thread tensions are not enough.	Slightly increase the upper and lower looper thread tensions.
	Looper thread take-up	The looper thread take-up (left) is too high.	Slightly lower the looper thread take-up (left)
	Knife width	The knife width is unsuited for the overedging width.	Make the overedging width slightly smaller than that given for the knife width.
	Thread path	Scratches on the thread path catch thread.	Check the thread path for scratches.
	Presser foot	The presser foot comes into contact unevenly with the throat plate and feed dogs and tends to meander.	Make the presser foot come into contact with them evenly.
	Thread stand	Thread is not smoothly fed.	Adjust the thread stand so that the thread is fed smoothly.
	10. The looper thread bulges out	Knife width	The knife width is too small for the overedging width.
Looper thread take-up adjustment		The looper thread take-up draws out excessive looper thread.	Raise the looper thread take-up (right) (increase in distance O)
11. Looper thread bite	Knife width	The knife width is too large for the overedging width.	Use a knife having width suited to the overedging width.
	Adjustment of the looper thread take-up	The looper thread take-up draws out insufficient amount of looper thread.	Lower the looper thread take-up (right) (reduction in distance O).

Trouble	Case (1)	Case (2)	Check and Corrective measures
12. Knotting position is not correct. Right side  Knots are deflected to the upper looper side.	Threading	Re-threading after thread breakage, etc. has been done erroneously.	See the threading diagram.
	Adjustment of the looper thread take-up	The height of the looper thread take-up (left) is not correct.	Raise the looper thread take-up (left) to increase the amount of upper looper thread, and the knotting position moves toward the lower looper side.
		The upper looper thread guide (right) is too short.	Increase distance K.
13. Uneven material feed	Presser foot pressure	The presser foot pressure is too high.	Reduce the presser foot pressure except for the uneven material feed due to puckering.
	Presser foot	The hinge is too stiff.	Remove the stiffness provided no hinge play is produced.
		Scratches on or defective finish on the presser foot sole produce friction between the presser foot and materials.	Buff the presser foot sole for good surface finish.
	Tilt of feed dogs	The front is too high.	Make the front down. However, be sure to align the differential feed dog with the main feed dog.
	Height of feed dogs	A different in level exists between the main feed dog and differential feed dog.	Eliminate the difference in level.
Adjustment of differential feed	The differential feed has been improperly adjusted.	Provide differential feed suited to the material.	

The first part of the document discusses the general principles of the system. It is divided into several sections, each dealing with a different aspect of the problem. The first section deals with the basic concepts and definitions. The second section deals with the methods of calculation. The third section deals with the results of the calculations. The fourth section deals with the conclusions of the study.

The second section deals with the methods of calculation. It describes the various techniques used to solve the problem. These include the use of differential equations, integral equations, and numerical methods. The results of these calculations are presented in the third section.

The third section deals with the results of the calculations. It presents the data obtained from the various methods and compares them with the theoretical predictions. The results show that the calculations are in good agreement with the theory.

The fourth section deals with the conclusions of the study. It summarizes the findings and discusses their implications. It is concluded that the system is stable and that the calculations are accurate.

1. DIMENSIONS OF TABLE (SEMI-SUNKEN TYPE)
 (1) Semi-sunken type

Part No. of table 12221602
 (Note) All dimensions are in millimeter.
 Detailed dimensions of section VV, section ZZ,
 section YY and section VV
